1981 USSR CROP OUTLOOK 1/

The wet weather patterns which prevailed over much of the European USSR in recent months continued during December with somewhat milder than normal temperatures. The wetness hindered fall seeding and limited the area of fall seeded grain. However, the mild weather permitted additional plant development before dormancy set in. Soil moisture conditions for seeding and germination of this year's winter grain crop were quite good.

By November 10, 1980, winter crops in the USSR had been sown on more than 38 million hectares with winter grains likely accounting for around 34 million. This compares with a planned grain area of 37 million. If winterkill, which typically has accounted for around 15 percent of the winter grain area, is about normal, the area remaining for harvest next summer could total 28 to 29 million hectares, well below this past years 32.5 million hectares.

Planting delays occurred early in the fall seeding season when seeding activity was concentrated in the northern half of European USSR, an area where rye is the predominant winter grain. Consequently, rye area may be down, while winter wheat which is higher yielding, will likely account for a larger share of the overall winter grain area this year.

A number of factors will affect the outlook for the 1981 USSR winter grain crop.

1. Fertilizer deliveries to the agricultural sector were probably up this fall from last year's low level, however, applications may have been hindered by late seeding and wet weather. Fertilizer response may be somewhat less than normal.

2. The exceptionally wet 1980 harvest may have reduced the supplies of quality seed for the 1981 crops which could have an adverse affect on crop yield potential.

1/ This is the first part of a two-part release on the current USSR situation.

3. The seeding delay this fall may have resulted in uneven crop development in many areas before the crop entered winter dormancy.

4. The most critical factor for winter grains between now and the start of the spring growing season will be the presence of sufficient snow cover to insulate dormant winter grains from cold temperatures.

The wet fall and early winter will provide a good moisture reserve for the spring seeded crops in the European USSR. However, snow fall has been modest so far this winter in the agricultural regions of Siberia, the Urals, and Kazakhstan. Additional snowfall will be needed to provide the badly needed moisture reserves for grain in these semi-arid areas.

Total grain area for the 1981 crop could well recover from the 126 million hectares estimated for this past year. The planned area for 1981 is 128 million hectares. At least part, if not all, the shortfall in fall seeded grain area could be made up next spring. However, the extent of any expansion in spring seedings will depend on the level of winterkill for winter grains and the conditions at spring planting time.

Over the past 10 years, yields for all grains in the USSR have averaged between 1.6 to 1.7 tons per hectare with extremes varying from 1.1 to 1.8 tons per hectare. Even if 1981 crop yields approach the high side of the range, the Soviets would find it difficult to achieve the production level of 236 million tons called for in their 1981 Plan.

Weather and Crop Conditions

Precipitation and temperature across much of the European USSR continued above normal during much of December. While most of the winter grain crop stayed dormant, significantly reduced snow cover and freeze-thaw weather increased concern about the crops susceptibility to winterkill. Recent storms have increased snow depths in some areas and increased the area of coverage, but more snow is needed in the winter wheat area to provide protection from any future cold air outbreak. The shallow root development resulting from excessively wet soil this fall will increase the winter grain crops vulnerability to the extremes of winter weather.

1980 Crop Estimate Unchanged

The USDA estimate of 1980 grain production in the USSR remains at 185 million metric tons, slightly above last year's harvest but 50 million

tons below plan. Only twice during the tenth five year plan (1976-1980) did production exceed goals. On average for this period, production fell around 16 million tons short of the planned level. There is still no official Soviet grain production report for the 1980 crop.

Prepared by USDA Interagency Task Force on USSR Grain Situation. The following USDA agencies participate as members of the USSR Task Force: Foreign Agricultural Service; Economics and Statistics Service; Agricultural Stabilization and Conservation Service; and the World Food and Agricultural Outlook and Situation Board.

USSR GRAIN SITUATION AND OUTLOOK 1/

Estimates for the 1980/81 grain balance in the USSR are basically unchanged from a month ago. The 1980 crop estimate continues at 185 million metric tons, well short of both the plan level and projected requirements. There is still no official Soviet grain production report for the 1980 crop. Grain imports for the 1980/81 marketing year are still projected at a record 34.5 million tons. Recently reported sales from Argentina and non-traditional suppliers such as Spain support this estimate.

A number of countries have signed contracts or announced grain sales intentions to the USSR, which would cover the July-June 1980/81 period. The accompanying table lists a portion of these commitments or intentions. In most cases, the bulk of the grain in these sales or intended purchases is expected to move before June 30, 1981. Some of these countries could well make additional grain sales for delivery during this period. So far this marketing year, the Soviets appear to have been able to ship, contract for, or establish commitments for at least 30 million tons of the projected imports of 34.5 million.

Grain shipments to the USSR, running at a fairly modest pace during July-September 1980 stepped up sharply during the October-December quarter. Heavy shipments from both the United States and Canada helped swell the total. Since U.S. grain shipments were resumed in October, the Soviets have lifted 3.8 million tons (as of January 1, 1981). Shipping intentions for January and February are indicated at 1.7 million and 1.1 million tons respectively, meaning that 6.6 million of the permitted 8 million tons, which can be shipped during the fifth year of this agreement may move during the October-February period.

Soviet grain shipments against all outstanding contracts were extremely heavy in October and November but appeared to have slackened some in December. The pace could continue subdued over the remaining winter months, but is expected to pick up sharply in March and April as winter passes.

1/ In FG-1-81 published on January 14, 1981, the USSR harvest estimate was unchanged from a month earlier's estimate of 185 million metric tons.

Apparently the USSR is continuing active grain buying in the world market. A number of sales were recently reported by non-traditional suppliers. There are also indications that Argentina's first wheat sales to the USSR out of the new harvest were made, totaling slightly over a million tons. An improving outlook for Argentina's corn and grain sorghum crops helps ensure ample availabilities of these grains for sale to the USSR.

Domestic Use Estimate Holds

The estimate of grain used for seed, industrial and food use remains at around 80 million tons. Feed use for 1980/81 is continued at last months estimate of 114 million tons. This is about 10 percent below last year's level and the lowest since 1976/77. However, the feeding estimate is subject to a large degree of uncertainty and could change given subsequent revisions in either the import estimate, an official Soviet announcement of the 1980 harvest, or a reassessment of Soviet stock policies. Reported increased Soviet purchases of feed concentrates, tapioca, and oil meals could take up some of the slack in grain for feed supplies. Soviet grain stocks are probably near minimum levels, as it is likely that the Soviets drew heavily against stocks in 1979/80 as a result of the poor harvest and limited supplies available from the U.S.

Livestock Inventories Continue Large

Despite tight feed supplies, Soviet livestock inventories in the socialized sector as of December 1, 1980 indicate record hog, cattle, cow and poultry levels, while sheep and goat numbers continued 2 percent below a year ago. Hog numbers had been below 1979 levels from February 1 to October 1, 1980, but made a slight gain by November 1. The maintenance of large livestock inventories in the socialized sector as reported by the Soviets may be due to: (1) an increase in feed imports in the final quarter of 1980, (2) a drawdown in livestock from the private sector while state and collective farms maintained holdings, (3) a decision by farms to maintain animal numbers in order to compete for bonuses which are based on livestock inventories on January 1, or (4) larger forage supplies. Despite these record December 1 inventories of most livestock categories, the growth in numbers from January 1, 1980 to December 1, 1980 were the slowest in the past several years, probably because of reduced feed availability and poorer feed quality.

The average weight of cattle and hogs procured by the Government during the January-November 1980 period reached 354 kg. and 101 kg., respectively. These weights are 2 percent below those in the same period of 1979, and 3 percent below 1978 levels. Marketing of cattle and hogs during that period was down by about 3 percent and 2 percent respectively, from 1979 levels.

Meat and milk production during January-November 1980 in the socialized sector continued to show declines from a year ago. Meat output fell by 3 percent from the level reached in the same period in both 1979 and 1978; beef, pork, and mutton dropped 5 percent, 4 percent, and 3 percent, respectively, while poultry showed a gain of 7 percent. Milk production was 3 percent below the January-November 1979 period and average milk yields per cow continued to indicate a 4 percent decline.

Prepared by USDA Interagency Task Force on USSR Grain Situation. WORLD GRAIN SITUATION AND OUTLOOK

The focal point in the global grain outlook, especially for wheat and coarse grains, is shifting beyond the 1980/81 marketing season and beginning to center upon the prospects for 1981/82. The primary reason for this is that current world grain stocks are unusually low. Additional reasons include the uncertain world economic climate, current weather conditions affecting 1981/82 winter grains in the Northern Hemishpere, and the unknown status of U.S. grain supply to the USSR--particularly for the period after October 1, 1981, following the expiration of the current 5-year US/USSR grains agreement.

This report not only provides an updated review of conditions and likely developments for the balance of 1980/81, but also offers a preliminary analysis of the general conditions that can currently be expected for 1981/82.

World Grain Situation/Outlook for the Balance of 1980/81

World trade in grains, including rice, is now expected to total a record 210 million tons in 1980/81, up by nearly 6 percent from the previous year and nearly double the level of a decade ago. Total U.S. grain shipments in 1980/81, including rice, are expected to total a record 119 million tons, up 7 percent from 1979/80, while exports by all other origins should total around 91 million tons or 3 percent higher than in the previous season. The major destinations of this increased world trade are China, the Soviet Union, Mexico, Brazil, South Korea, and Taiwan.

1/ The December projections have been adjusted to reflect revisions in the Chinese historical levels.

This circular was prepared by the Grain and Feed Division, Commodity Programs, FAS/USDA, Washington, D.C. 20250. Further information may be obtained by writing the Division or telephoning (202) 447-2009.

Note: The previous report in this series was World Grain Situation and Outlook for 1980/81: Foreign Agriculture Circular FG-35-80, December 12, 1980. For further details on the world grain production and the USSR outlook, see "World Crop Production" Foreign Agriculture Circular WCP-1-81, January 14, 1980; "1981 USSR Crop Outlook" Foreign Agriculture Circular FG-1-81, January 14, 1981; and "USSR Grain Situation and Outlook" Foreign Agriculture Circular FG-2-81 January 15, 1981.

Major developments in the world grain economy over the past month that have affected the 1980/81 situation and could begin to have an impact on the 1981/82 outlook include:

- Improved corn and grain sorghum crop prospects in the Southern Hemisphere, which could mean larger exportable surpluses; and

- An increase in the estimate of China's 1980/81 wheat imports to 14 million tons.

WHEAT

Post harvest adjustments have resulted in little overall change this month in the 1980/81 wheat situation and outlook. Although aggregate production is currently estimated at about 500,000 tons below last month's figure, global utilization is seen as likely to be lower by roughly the same amount, leaving the 1980/81 carryover stock position relatively unchanged.

Outlook for Importing Countries. The level of 1980/81 import demand for wheat is now estimated to exceed last month's record forecast of 92 million tons by about 1 million tons. The most notable change in the anticipated aggregate trade flow is for China, where imports of one million tons of wheat above the previously forecast level are currently expected. Over the past few months, it appears that China, where total grain outturn fell short of the 1979 level by 12 million tons, is opting for wheat imports. Active buying to date has brought import commitments to nearly 13 million tons, well over 90 percent of China's forecast import needs. Import needs have also been adjusted upward for South Korea, where wheat flour consumption is expected to rise as a result of the shortfall in Korea's rice crop this year, and in Indonesia. Partially offsetting these increases are reductions in the import estimates in a number of other nations, including Morocco, due partially to greater than expected domestic production.

Outlook for Major Exporters. With wheat supplies largely unchanged, the outlook for the major exporting countries is for slightly higher exports and consequently marginally lower stocks.

Canada has been actively shipping wheat, with exports as of the first half of the 1980/81 July/June year running at almost 2.4 million tons ahead of last year's level. Canadian wheat exports in the 1980/81 season may therefore reach a record 16 million tons, 500,000 tons above the previous forecast, and 1 million tons above last year's estimated level. Stocks are expected to be reduced to minimal levels.

Argentine wheat shipments continue to be estimated at about 4 million tons for the July/June year and are expected to go mostly to the Soviet Union. Roughly 600,000 tons have been shipped from July to the end of October, some 42 percent ahead of last year's schedule.

Exports from the 1980 bumper wheat harvest in the European Community (EC) are still expected to climb to 12.5 million tons, some 30 percent above the previous record of the 1979/80 season. In a recent action taken by the EC Commission, a special incremental subsidy, amounting to 5 ECU per ton (the equivalent of roughly US$6.50) has been made available for

Community wheat shipments to China. The additional subsidy, which will mainly affect French wheat, is expected to partially mitigate the cost of transporting the grain to the distant Chinese market. It is also likely to spur initial shipments of wheat which France had agreed to supply to China under a bilateral agreement signed in September of 1980. The Community also recently authorized the export of 40,000 tons of wheat to Latin America. This represents the first time in many months that EC wheat exports have been approved to this market.

Spain, which enjoyed a bumper crop this season, is expected to export some 1.3 million tons of wheat this year, 300,000 tons more than previously envisioned. A large part of Spain's exportable surplus appears to be destined for the Soviet Union.

Wheat Shipments by Major Exporters
July-December, 1979 and 1980
(1,000 metric tons)

	U.S.		Canada		Australia		Argentina	
	1979	1980	1979	1980	1979	1980	1979	1980

Balance	19068	19534	5890	6259	5690	3508	1046	392

* Partially estimated.

Outlook for the U.S. No change is envisaged in the 1980/81 U.S. export estimate. On a 1980/81 marketing year basis, U.S. wheat exports are still estimated at a record 41.5 million tons (1,525 million bushels). Recent purchase activity in the U.S. market by China, Mexico, Egypt, Japan, Brazil, and S. Korea has been brisk and the outlook is for continued strong demand this spring.

During the June-November period, shipments represented about 49 percent of the 12 month estimate leaving roughly 51 percent to be shipped during the December-May period. The percentage remaining to be exported is somewhat high in our historical context, but similar to 1977/78 when U.S.

December-May exports represented over 50 percent of the annual total, partially a result of reduced exports by other major shippers. Shipments by the other major exporters may be somewhat reduced again this year vis-a-vis year earlier levels due to reduced exportable surpluses.

Flow of U.S. Exports of Wheat and Wheat Products
During Specified Periods Including 1980/81 Forecast

1980/81 forecast	20.5	49.4	21.0	50.6	41.5

Source: U.S. Census

In addition, under current conditions, the other exporters may be selling a greater proportion of their reduced export availabilities to the Soviet Union. An expected overall decline in exports by the other major shippers, especially to non-Soviet destinations, tends to be reflected in U.S. wheat export sales commitments, which currently indicate that slightly over 80 percent of the total estimated U.S. June/May marketing year sales to non-Soviet destinations has been made. This level is more or less in line with the historical position at this time of the year.

COARSE GRAINS

With harvesting completed in much of the world and Southern Hemisphere crops progressing through the vegetative stage, the global outlook for coarse grains appears largely unchanged from last month. Despite a slight increase in estimated outturn in Eastern Europe, and improved prospects in Argentina and Australia, an increase in estimated aggregate utilization results in the maintenance of last month's estimated ending stocks level of 55 million tons.

Although the overall 1980/81 trade estimate is not changed significantly from the December publication, brisk purchasing activity on the part of some major importers indicates a desire to assure adequate supplies in the face of the relatively tight coarse grain position this year.

Outlook for Importers. Although 1980/81 global trade in coarse grains is still expected to hover around last month's estimated 104-million-ton record, some shifts within the aggregate are likely to occur. A bumper barley harvest in Spain this year is expected to relieve pressure on imports. Additionally, Mexico is expected to import 400,000 tons more corn and/or sorghum than previously considered likely.

Japan, which is the largest single coarse grain importing nation and relies almost exclusively on foreign grain for livestock feeding, has been an active purchaser during the first half of the July/June 1980/81 season. In July-December of 1980, Japanese purchases of barley, corn, and sorghum from the U.S. alone totaled some 19 million tons, compared to about 16 million in the corresponding period of 1979. This reflects Japan's apparent desire to firm up, ahead of usual, large quantities of feedgrains required, given their relative scarcity this year.

The outlook for major exporters remains largely unaltered from last month. Although recent rainfall in various regions of the Southern Hemisphere has improved soil moisture conditions, many factors remain which could still alter output as crops pass through the various growth stages.

Recent precipitation has brightened the outlook for Argentina's corn crop, now expected to reach a recent high of 10 million tons from the previous estimate of 9.4 million. Production of this magnitude is expected to boost marketing year shipments to 6.6 million tons, some 600,000 tons greater than earlier anticipated. Prospects for Argentine sorghum have also brightened, although no change in the estimated production or trade levels are envisioned at the present time. Argentina recently revised its supply agreement with Mexico, wherein the former agreed to provide Mexico with up to 1 million tons of sorghum annually over the 2-year period which commenced January 1, 1981.

Prospects for Australian sorghum have improved slightly. Precipitation somewhat relieved earlier dangers of stress and prompted a slight increase in estimated sorghum outturn, with a minimum impact on marketing year exports.

At the present time, soil moisture in South Africa appears adequate as the corn moves into and beyond the tasseling stage. Estimated coarse grain exports from this producing country are still placed at a record 3.9 million tons.

The outlook for Canada remains unchanged from last month, while both the EC and Spain are expected to move more barley into export channels than previously anticipated.

Outlook for the U.S. Foreign demand for U.S. coarse grains is expected to remain strong throughout the remainder of the 1980/81 season. Sizable purchases have recently been made by Japan and Brazil, in addition to Mexico, wherein some railcar movement has been resumed after a temporary halt. As of January 1, combined U.S. exports of barley, corn, and sorghum, on a July/June basis, were roughly 37 million tons, some 550,000 tons above the corresponding level 1 year ago. As of January 1, however, total commitments for these grains, including sales outstanding, to all destinations exclusive of the USSR, are running at roughly 27 percent above last year's level.

RICE

The global outlook for rice has undergone no major changes since the previous issue in this series. A small downward adjustment on the production side, combined with a small expansion in expected utilization and trade levels, is likely to lead to a slight constriction in the forecast stock position, although aggregate carryover stocks are still expected to be the second highest on record.

Outlook for Importers. The slight increase in trade is accounted for by an increase in forecast 1981 imports for West Germany. No other modifications from last month are currently expected on the import side.

Outlook for Major Exporters. The scenario for major rice exporters in 1981 is largely unchanged from last month. The EC is expected to export slightly more rice than earlier, some of which will be sold to Poland at below market prices. Thai exports are still expected to total some 2.8 million tons, at least 100,000 tons of which have been sold to the Soviet Union.

The outlook for the U.S. is unchanged from last month, with exports still expected to reach a record 3.2 million tons. U.S. exports are forecast to remain strong to South Korea, Iraq, Nigeria, Saudi Arabia, and Peru, among others.

Early Outlook for Wheat and Coarse Grain in 1981/82

At this point, several prominent factors affecting the 1981/82 world wheat and coarse grain situation point toward prospects significantly different from those foreseen prior to the 1980/81 season. In the report FG-17-80, of May 1980, the first detailed assessment of likely prospects for 1980/81, it was indicated that, barring very unusual weather, world grain requirements and production would be approximately equal in 1980/81 and that, if poor crop weather were to occur, a significant decline in global stocks would result. At this early stage, however, preseason prospects for 1981/82 are much different from those of a year ago. Current indications of larger global plantings suggest that production is likely to exceed world utilization and that a global stock drawdown might not occur unless weather would be unusually poor. The factors that have emerged to cause a difference in outlook this year are mainly the following:

1. Likely expanded grain acreage in major exporting countries, including a large increase already indicated for winter wheat in the United States, creates a framework for an exceptionally large crop with good weather and provides insurance against further stock drawdown with poor weather.

2. Expectations of continued strong grain prices in an atmosphere of uncertain world economic conditions in coming months could cause a slowdown in livestock feeding patterns.

3. Higher grain price could act as an encouragement to boost yields in some areas, especially in the United States.

4. Limited supplies have forced a cutback this season from the level of planned grain utilization in the USSR. Even with improved domestic supplies and greater access to foreign grain, Soviet consumption in 1981/82 is not expected to recover to the level of 1978/79.

Any of these new factors has the effect of reducing the likelihood of a further drawdown in world grain stocks in 1981/82, and conversely, increasing the likelihood of a stocks buildup from the low 1980/81 level, particularly in the event of favorable weather. However, these prospects are extremely tentative at this stage. Weather conditions have not been favorable to the winter wheat crop in the United States so far this season, although for the rest of the Northern Hemisphere conditions have been relatively good for winter grains.

Current prospects indicate that wheat is more likely to show a larger stocks buildup than coarse grains in 1981/82. Estimated world wheat carryout stocks from 1980/81 are more adequate than the sharply reduced coarse grain stocks. The greatest acreage expansion in 1981/82 is expected to occur in wheat. Some alleviation of this likely stock buildup could occur, however, if the improved wheat supply, especially in certain countries exerts pressure on wheat prices, narrowing the spread between wheat and coarse grain and leading to an increase in wheat feeding.

Production

By comparison with the weather-reduced 1980/81 crop, if yields are close to trend, it appears at this early stage that global wheat and coarse grain production could be up sharply next season. With normal weather, world wheat and coarse grain production in 1981/82 could set a new record, easily exceeding this season's estimated 1.15 billion tons and the previous high of 1.20 billion tons in 1978/79. A significant grain area expansion is expected in the United States compared with 1980/81. A strong response to actual or anticipated higher prices this spring could boost U.S. and global acreage even further, and might also provide a stimulus to boost yields in some countries. However, relatively strong prices for other crops implies intense competition for spring planted area in the United States and Argentina.

The major export competitors--Canada, Australia, and Argentina--are each expected to pursue policies designed to increase grain area, particularly wheat. Current and prospective prices would tend to support a shift from oilseeds to grain in several of these countries. Increased production in other countries will depend less on acreage expansion and more on normal or improved weather conditions. A major factor affecting 1981/82 world grain output would be a return to more normal yields in the USSR after two poor harvests, and a recovery in yields of spring planted grains in the United States.

In the Northern Hemisphere, U.S. winter wheat plantings are a record, with total U.S. wheat acreage planted expected to exceed the previous record of 34.3 million hectares in 1948/49. Winter grains in the United States are generally rated fair to good at this point, although there is considerable concern over current short moisture supplies in some areas. Winter wheat area should be somewhat smaller in East Europe and the Soviet Union--the world's major wheat producing region--owing to difficult fall sowing conditions. However, the likelihood of improved yields compared with the stunted yields of the past 2 years in the USSR could easily offset this area decline. In China, wheat area probably will continue its downward trend, but a return to normal weather should raise 1981 production well above the 1980 shortfall. At this early date, there is nothing to indicate seriously abnormal wintering conditions in any of these areas. Canadian wheat plantings, predominantly spring, are at this stage expected to be up compared with 1980/81.

Consumption

Wheat and coarse grain consumption can again be expected to expand in 1981/82 over the estimated record 1.19 billion tons consumed during 1980/81, although the increase is likely to fall short of production expansion. The rate of expansion in wheat and coarse grain usage will depend on the impact of higher prices or anticipated higher prices on world grain use, especially feed use. Unfortunately, historical analysis for the world as a whole or major foreign countries gives little basis for estimating the current price impact on world consumption. Adjustments can be almost instantaneous, as in the United States, or, as in countries where internal price levels are insulated from the world market, adjustments may be relatively minor or delayed by months or even years from the time of any sudden change in the world markets. Preliminary indications show, however, that the rise in grain prices is likely to modestly slow the long-term world uptrend in livestock feeding rather than change its direction in 1981/82. However, strong underlying trend toward higher grain consumption in developing countries, combined with

moderate expansion in the Industrialized Western Countries and in East Europe, sets the stage for increased grain use. Overall consumption is, highly dependent upon the profitability of U.S. livestock feeding and on the extent to which the USSR can regain its momentum and return to previous levels of grain feeding. (The U.S. and USSR account for about a third of global grain usage).

Stocks

Under the conditions outlined above, rebuilding of global wheat and coarse grain stocks is possible during 1981/82 following this year's unusually large stocks drawdown. Only very large production shortfalls in several important importing or exporting countries would be likely to lead to a further world stock reduction. A geographical shift in stocks availabilities could occur, however, if the USSR harvests a good crop and continues to import at high levels to replenish its depleted grain stocks.

Trade

With the forecast strong demand, the overall volume of world grain trade is expected to increase again in 1981/82, following the trend set in the last 10 years. However, the size of the trade expansion could be dampened by any consumption slowdown in importing countries, or by a reduction in USSR imports that might occur in the event of a very large Soviet crop.

Imports by China could fall somewhat with a larger 1981 crop, but this drop should be more than offset by import growth in other countries. The USSR will again be a very important factor in the 1981/82 import situation. Whether or not U.S. trade restraints are relaxed, the USSR is likely to be a very large importer of grain during the coming year. Only if it experiences an exceptionally good 1981 harvest will there be a possibility of a sharp decline in Soviet imports coupled with needed stock rebuilding. Faced with rising feed needs, East Europe is expected to continue to be a strong market, though moderating slightly from the 1979/80 high. Import demand from West Europe and Japan should continue strong, but possibly slackening somewhat with higher prices and/or changed economic conditions.

Barring unfavorable weather, the United States should have expanded export availabilities for 1981/82 from a combination of a much larger crop and still sizable beginning wheat stocks. With both wheat and coarse grain carry-over stocks substantially reduced in Canada and Australia, and with Argentina normally holding few stocks, 1981/82 export availabilities in those countries will be highly dependent on climatic conditions. In the EC, little change in export availabilities is expected with normal weather.

1) FEED USE DATA IS UNAVAILABLE FOR MAINLAND CHINA
2) FOR CHINA, UTILIZATION ESTIMATES REPRESENT "APPARENT" UTILIZATION, I.E. , THEY ARE INCLUSIVE OF ANNUAL STOCK LEVEL ADJUSTMENTS FOR CHINA, WHERE NO STOCKS DATA ARE AVAILABLE.
3) OFFICIAL SOVIET SOURCES HAVE REPORTED TOTAL GRAIN PRODUCTION FOR 1979 AT 179 MILLION TONS, WHICH INCLUDES MISCELLANEOUS GRAINS, PULSES, AND RICE, ESTIMATED AT 9 MILLION TONS FOR 1979.
4) PRELIMINARY
5) PROJECTION
6) COARSE GRAINS INCLUDE BARLEY, RYE, OATS, CORN, SORGHUM, AND MILLET. EXCLUDES MISCELLANEOUS GRAINS, PULSES, AND RICE.
SOURCE: PREPARED OR ESTIMATED ON THE BASIS OF OFFICIAL STATISTICS OF FOREIGN GOVERNMENTS, OTHER FOREIGN SOURCE MATERIALS, REPORTS OF U.S. AGRICULTURAL ATTACHES AND FOREIGN SERVICE OFFICERS, RESULT OF OFFICE RESEARCH AND RELATED INFORMATION.

NOTE: STOCKS AS % OF UTILIZATION IS THE RATIO OF MARKETING YEAR ENDING STOCKS AND TOTAL UTILIZATION.

1) STOCKS DATA ARE BASED ON AN AGGREGATE OF DIFFERING LOCAL MARKETING YEARS AND SHOULD NOT BE CONSTRUED AS REPRESENTING WORLD STOCK LEVELS AT A FIXED POINT IN TIME. STOCKS DATA ARE NOT AVAILABLE FOR ALL COUNTRIES AND EXCLUDE THOSE SUCH AS THE PEOPLE S REPUBLIC OF CHINA AND PARTS OF EASTERN EUROPE; THE WORLD STOCK LEVELS HAVE BEEN ADJUSTED FOR ESTIMATED YEAR-TO-YEAR CHANGES IN USSR GRAIN STOCKS, BUT DO NOT PURPORT TO INCLUDE THE ENTIRE ABSOLUTE LEVEL OF USSR STOCKS.
2) TRADE DATA AS EXPRESSED IN THIS TABLE EXCLUDES INTRA EC-9 TRADE.
3) FOR COUNTRIES FOR WHICH STOCKS DATA ARE NOT AVAILABLE (EXCLUDING THE USSR), UTILIZATION ESTIMATES REPRESENT "APPARENT" UTILIZATION, I.E., THEY ARE INCLUSIVE OF ANNUAL STOCK LEVEL ADJUSTMENTS.
4) PRELIMINARY.
5) PROJECTION

SOURCE: PREPARED OR ESTIMATED ON THE BASIS OF OFFICIAL STATISTICS OF FOREIGN GOVERNMENTS, OTHER FOREIGN SOURCE MATERIALS, REPORTS OF U.S. AGRICULTURAL ATTACHES AND FOREIGN SERVICE OFFICERS, RESULTS OF OFFICE RESEARCH AND RELATED INFORMATION.

FOOTNOTES TO WORLD GRAIN SUMMARY AND TRADE TABLES

1) Includes wheat flour and products.
2) Argentina, Australia, Canada, South Africa, and Thailand. Production and trade figures exclude South African wheat.
3) Adjusted for transshipment through Canadian ports: Excludes products other than flour.
4) Wheat, rye, corn, barley, oats, sorghum, millet, and mixed grains.
5) Production data include all harvest occurring within the July-June year indicated, except that small grain crops from the early harvesting Northern Hemisphere areas are "moved forward;" i.e., the May 1977 harvests in areas such as India, North Africa, and southern United States are actually included in "1977/78" accounting period which begins July 1, 1977.
6) "Bunker weight" basis; not discounted for excess moisture and foreign material.
7) Utilization data are based on an aggregate of differing local marketing years. For countries for which stocks data are not available (excluding the USSR) utilization estimates represent "apparent" utilization, i.e., they are inclusive of annual stock level adjustments.
8) Stocks data are based on aggregate of differing local marketing years and should not be construed as representing world stock level at a fixed point in time. Stocks data are not available for all countries and exclude those such as the People's Republic of China, and parts of Eastern Europe: The world stock levels have been adjusted for estimated year-to-year changes in the USSR grain stocks, but do not purport to include the entire absolute level of USSR stocks.
9) Inclusive of Soviet stock changes: See footnote 8.
10) Corn, barley, oats, sorghum, millet, and rye, excluding products.
11) Corn, barley, oats, rye, sorghum, millet, and mixed grains.

Note: Projections included for the U.S. in all the tables are the levels agreed to in the latest agricultural supply-demand estimates reports.

REFERENCE TABLES ON WHEAT, CORN, AND TOTAL COARSE GRAINS SUPPLY-DISTRIBUTION FOR INDIVIDUAL COUNTRIES

This publication contains the latest available supply and distribution estimates for wheat, corn, and total coarse grains for each country in the Foreign Agricultural Service grains data base. Estimates are continually being reviewed; the contents herein reflect information available through January 16, 1981, and correspond to the world summaries released the same date in FG-3-81, World Grain Situation/Outlook for 1980/81. The data are prepared or estimated on the basis of official statistics of foreign governments, other foreign source materials, field reports from U.S. Agricultural Counselors, Attaches, and Foreign Service officers, results of office research, and related information.

An updated computer tape containing the complete 20-year data base for all grains including rice, as well as data for various other agricultural commodities, is issued twice yearly and can be purchased through the National Technical Information Servies (NTIS), Computer Production Division, Department of Commerce, Springfield, Virginia 22161.

This circular was prepared by the Grain and Feed Division, Commodity Programs, FAS/USDA, Washington, D.C. 20250. Further information may be obtained by writing the Division or telephoning (202) 447-2009.

NOTES AND EXPLANATIONS ON THE DATA BASE

1. The year in parentheses in the far left column represents "world" production year beginning July 1 of the year indicated. Thus, 1979 production data include all harvests occurring within July-June 1979/80, except that small grain crops from the early harvesting Northern Hemisphere areas are "moved forward"; i.e., the May 1979 harvests in such areas as India, North Africa, and the southern United States are actually included in the 1979/80 accounting period that begins July 1, 1979.

2. The year shown without parentheses represents the marketing year, and refers to the 12-month period following harvest. In the case of some Southern Hemisphere countries, production that occurred in the "world" production year 1978 may be distributed in the country's 1979/80 marketing year. The marketing year designated for some country series has changed over the historical period as a result of a change in the official marketing year or a change in the official data source.

3. For countries where stocks data are unavailable, "total consumption" represents apparent consumption; i.e., consumption inclusive of annual stock changes.

4. The final three columns to the extreme right side of each page represent the July-June trade period. These columns are often used in aggregations of individual countries, allowing trade data to be expressed during a common 12-month time frame. These columns are preceded by the appropriate year designation for each line; i.e., the year designated 80 covers trade during the July 1979-June 1980 time period.

5. Coarse grains include corn, barley, sorghum, oats, rye, millet, and mixed grains.

6. The complete USDA data base as compiled by the FAS Grain Division currently covers the production years 1960 through 1980.

7. Reference tables on rice supply-distribution for individual countries appear in FG-38-80, published in December 1980.

8. Conversion factors:

1 hectare	= 2.471 acres
1 metric ton	= 2204.622 pounds
1 metric ton	= 36.7437 bushels of wheat
1 metric ton	= 39.368 bushels of corn

PRC GRAIN TRADE TO REACH NEW HIGH

Summary

The continued brisk pace of shipments and sales of foreign grain to China through December 1980, suggests that Chinese imports for the July-June 1980/81 marketing year could be as much as 40 percent above the previous high of 11.1 million metric tons achieved in 1978/79. Total imports are currently estimated at 15.5 million tons. Wheat sales, which already have surpassed previous levels, are expected to account for at least 90 percent of that total. Numerous factors point to a continued high level of Chinese import demand over the next few years, although the pattern of trade with major suppliers could differ somewhat from that in the current year.

Recent Trade Developments

As of January 1, 1981, China had purchased nearly 14.0 million tons of grain for 1980/81 delivery, or about 5 million tons more than was purchased by that date last year for 1979/80 shipment. Moreover, since the beginning of the current marketing year, grain has been shipped to China at record or near-record levels each month.

This circular was prepared by the Grain and Feed Division, Commodity Programs, FAS/USDA, Washington, D.C. 20250. Further information may be obtained by writing the Division or telephoning (202) 447-7700.

The rapid pace of shipments and sales to China, sustained through the last quarter of 1980, is likely to continue through at least the first half of 1981. Since October 1980, Canada has sold 1.4 million tons of wheat, Australia 1.0 million tons and the United States over 3.3 million tons of wheat (including 550,000 tons for early 1981/82) and over 300,000 tons of corn. Also since October, China signed agreements with Argentina, the United States, France, and Thailand. Significant additional sales are expected, as the Chinese have yet to negotiate contracts under their bilateral agreements with Argentina and France, and for the second half of the final year of their agreement with Australia. Given recent assessments of China's 1980 autumn harvest, corn sales, primarily from the United States, may also pick up.

The Pattern of China's 1980/81 Imports

Despite an anticipated 4.5-million-ton increase in Chinese imports this year, total imports from traditional non-U.S. suppliers will be below last year's level. Australia, Canada, Argentina, the EC, and Thailand are expected to provide only about one-third of China's total import requirements, as compared with about 65 percent in 1979/80 and 50 percent in 1978/79. Because the United States traditionally has been more or less a residual supplier of grain to that market, the availability and relative price of grain from other origins has had a significant bearing on the level of U.S. exports in a given year. In the current year, the available supply of grain for China from non-U.S. sources has been limited by poor crop conditions and increased demand from the Soviet Union. Hence, for the first time since 1973/74, when the United States supplied about 75 percent of China's import needs, Chinese imports of U.S. grain will surpass total grain supplied to China from all other origins.

Imports From Non-U.S. Suppliers

Canada, which is expected to sell an unprecedented quantity to the Soviets this year, has contracted at the low end of the range indicated in its 3-year bilateral wheat agreement with China. In the case of Australia, which has a 3-year agreement with China calling for sales of 2.0-2.5 million tons of wheat per December-November year, only 1.5 million tons were contracted for the second (December-November 1979/80) year, and only 1.0 million tons have been sold against the third year of the agreement. Moreover, the reduced 1980 Australian crop makes it unlikely that additional contracts will bring the December-November 1980/81 total above the annual minimum.

Despite Argentina's January 1979-December 1980 agreement to supply up to 1.0 million tons of wheat and corn annually, a poor 1980 coarse grain crop, an average wheat crop, and exceptionally large sales to the Soviet Union contributed to increased Argentine prices and the low level of Calendar Year 1980 sales to China. Only 200,000 tons of wheat have been sold thus far for delivery during July-June 1980/81. Although the new Argentine wheat crop will be close to that of 1980, and the outlook for 1981 coarse grain production is optimistic, some of the same factors may again keep Argentine sales to China well below the annual 1.0-1.5 million tons of wheat, corn, and soybean trade agreed upon in the new 4-year bilateral agreement signed last September.

While both Thailand and France have sufficient supplies this year to export the 200,000 tons of corn and 500,000-700,000 tons of soft wheat provided for in their respective 1981 sales target and new agreement with China, French sales are likely to be limited considerably by high transportation costs to that market. The EC Commission, however, has recently instituted a differential additional subsidy for the Chinese market which will make French wheat more competitive.

Imports from the United States

Several indicators point to the likelihood that U.S.-China grain trade in 1980/81 will reach a level at least 2½ times the 4 million tons of 1979/80 and more than three times the average annual level of the last 3 years. Because of the relatively large exportable supplies of U.S. wheat during the past 6-8 months, the United States by the end of 1980 had sold over 8.5 million tons of wheat and 500,000 tons of corn for delivery in the current July-June year. Chinese purchases of U.S. grain by the end of 1978 and 1979 (for delivery during July-June 1978/79 and 1979/80,) had reached about 6.3 million tons and just over 2.0 million tons, respectively. The rate of monthly shipments for the current year also has far outpaced that of previous years. Monthly deliveries between July and December 1980 averaged nearly 1.0 million tons, as compared with little more than 500,000 tons and 300,000 tons during the same period in 1978 and 1979, respectively. With about 3.0 million tons of purchased grain remaining to be shipped after January 1, 1981, the rate of shipments in the January-June period also will be high.

Those January-June deliveries, which will count towards the first year of the new, 4-year U.S.-China grain agreement, satisfy only half the minimum annual purchase requirements stipulated in the agreement. (Under the agreement, the Chinese will import a total of at least 6-8 million tons of wheat and corn per year, but may take up to 9 million tons without giving prior notification to the U.S. Government.) In light of recent assessments of both Chinese needs and the export availabilities of other suppliers, it appears that: (1) Chinese imports of U.S. grain during the first agreement year (January-December 1981) will approach the upper end of the range, and (2) further purchases, particularly of corn, for July-June 1980/81 may be forthcoming.

Factors Affecting Trade

One reason for this year's record trade activity is the reduced level of Chinese grain production in 1980. Severe drought during much of the growing season in important grain areas of the North China Plain, as well as a decline in area planted, contributed to estimated production declines of 5.5 million tons in wheat and 4.5 million in coarse grains from 1979 estimates. In addition, major rice-growing provinces along the Yangzi and Huai Rivers were hit last summer and fall by the worst floods since 1954. Rain and low temperatures delayed planting, growth, ripening and harvesting in several provinces and, in combination with a drop in area, resulted in an estimated 2.5-million-ton production shortfall. In a preliminary assessment of total 1980 grain production (including soybeans, miscellaneous grain and pulses) the Chinese have indicated a shortfall of 10-15 million tons below the 332-million-ton record of 1979.

Recent Chinese policy, which has been giving increasing emphasis to the "adaptation of production to local conditions" and to greater agricultural decentralization, has facilitated a gradual shift in area from grain to "economic crops" such as cotton and oilseeds. If grain area continues to decline over the next few years, China's dependence upon improved yields and the vulnerability of grain crops to volatile Chinese weather will increase. Such policy reinforces China's need for access to large quantities of imported grain.

Nevertheless, domestic production is by no means the only, or even the most important, factor behind Chinese import needs. Indeed, the 1980 crop was the second largest in Chinese history, and followed two record harvests that presumably allowed for some stock buildup. (Stock information is not available.) However, population growth, continuing migration into the cities (most, if not all, imported grain is used in eastern Chinese coastal cities), attempts to increase supplies to grain-deficit areas, rising income, and a move toward mass-produced grain products in the cities have contributed significantly to the growth in Chinese demand for grain. Furthermore, both the promotion of "economic crops" and the official decision not to increase procurement quotas over the next few years will reduce the growth rate of government procurements at a time when demand for grain in the cities and in areas gradually becoming more specialized in other crops is rising.

Outlook for Future Trade

Weather conditions for the next winter wheat crop, planted in the fall of 1980, have thus far been more favorable than the poor conditions for the last crop. Assuming good weather throughout the growing season, some recovery will be forthcoming in winter wheat production this year, despite an apparent further decline in area planted. Area sown to spring wheat is expected to increase, but total wheat area will probably fall below that of 1980.

In light of the above factors, the string of long-term bilateral agreements, and early indications that the Chinese intend to renew their agreement with Australia when it expires this November, it appears that the Chinese plan to maintain a high level of grain imports over the next few years. Although 1980/81 needs may be particularly high because of the crop shortfall, commitments under those agreements imply annual import requirements of 12.3 to 17.2 million tons, 1 to 6 million tons greater than the previous record.

Apparently, Chinese leaders are attempting to open the way for increased grain consumption, even at a time when production has turned more toward cash crops. Imports, therefore, may receive increasing emphasis, at least in the near future. One constraint, however, is the availability of foreign exchange. Foodgrain imports are likely to remain a top priority in terms of foreign exchange allocation, but high coarse grain prices could force feed imports to increase more slowly. Nevertheless, there is potential for feedgrain imports to rise substantially in the years to come if China's long-term intentions to raise dietary standards by developing a more sophisticated animal feeding industry receive a higher priority than they do at present.

Current Grain Trade Commitments with China for 1980/81
(In 1,000 metric tons)

Commitments for Shipment After July 1, 1980 1/	Quanity and Grain	Comments
United States		
Sales made prior to July 1, 1980	2,329 wheat; 0 corn	-- Approximately 2.8 million tons wheat and 66,000 tons corn to be shipped after Jan. 1, 1981, and will be included in first agreement year.
Sales made after July 1, 1980	6,453 wheat; 501 corn	-- Wheat sales after July 1 include 550,000 tons for probable delivery June and July 1981.
Canada		
Sales made prior to July 1, 1980	1,622 wheat	-- Includes 1.4 million ton contract for delivery Aug 1980-Jan 1981 (first half of second agreement year) and 222,000 tons shipped July 1980, from previous agreement year.
Sales made after July 1, 1980	1,400 wheat	-- Contract for second half of Aug-July 1980/81 agreement year; expected delivery Feb-July 1981
Australia		
Sales made prior to July 1, 1980	459 wheat	-- Shipped July and Aug. 1980 against second agreement year (Dec-Nov. 1979/80)
Sales made after July 1, 1980	1,000 wheat	-- First contract against third agreement year (Dec-Nov. 1980/81); expected delivery Jan-April, 1981.
Argentina		
Sales made prior to July 1, 1980	0	
Sales made after July 1, 1980	200 wheat	-- Old crop wheat sold for Nov. and Dec. 1980 delivery, under old agreement expiring December, 1980.
France		
Sales made prior to July 1, 1980	150 wheat	-- Shipment expected to have been completed prior to 1981 beginning of new agreement.
Sales made after July 1, 1980	0	
Subtotal	13,613 wheat, 501 corn	-- Wheat subtotal includes a small amount from the U.S. and Canada scheduled for shipment after June 30, 1981.
Annual Commitments Under Agreements		
United States	6,000-8,000 wheat & corn	-- Agreement signed Oct. 21, 1980, for period January 1981-December 1984, for wheat and corn; 15-20% corn; option to purchase up to 9 million tons without prior notification.
Canada	2,800-3,500 wheat	-- Agreement signed February 1979 for August 1979-July 1982 period, for wheat. Contracts covering minimum made so far for 1980/81.
Australia	2,000-2,500 wheat	-- Agreement signed Jan. 1979 for December 1978 -November 1981, for wheat. Only 1,000 tons contracted thus far for 1980/81; possible new contract in Feb. or March 1981.
Argentina	1,000-1,500 wheat, corn, soybeans	-- Agreement signed September 1980 for Jan 1981-Dec.1984, for wheat, corn, soybeans. Majority must be wheat. No contracts as yet for 1981.
France	500-700 soft wheat	-- Agreement signed Sept 1980 for 1981-1983, for soft wheat. No sales made thus far.
Thailand	200 corn	-- Agreement on a "purchase target" for 1981 only, reached in October, 1980, for 200 corn; target also includes 100 rice and 40 beans for total of 340. Targets and contracts normally are negotiated on an annual basis.
Total	12,500-17,400 2/	

1/ As of January 1, 1981.
2/ 17,400 includes option under U.S. agreement to purchase up to 9 million tons without prior notification. Also includes Thailand purchase target for 1981; such targets are negotiated annually.

USSR GRAIN SITUATION AND OUTLOOK 1/

The grain balance for the USSR has been revised following official Soviet reports on the 1980 crop and revisions in the composition of estimated grain imports for 1980/81. The official USSR crop estimate was reported at 189.2 million tons. Wheat production was set at 98.1 million tons, coarse grains at 81 million, and miscellaneous grains and pulses at 10 million. The adjustments in the wheat and coarse grain production have resulted in changes in the feed utilization estimates.

The estimate of grain used for seed, industrial, food use, and dockage, remains around 80 million tons. Feed use has been increased by 4 million tons to 118 million, with wheat's share increased from 42 million tons to 50 million and the coarse grain feeding estimates cut back from 68 million to 64 million.

Flour purchases appear to have dominated the USSR's recent activity in the marketplace. Market reports have indicated significant flour sales to the USSR from Canada, Spain, and some member countries of the EC. This is an unusual development in Soviet purchasing patterns. In the past, Soviets have bought modest amounts of flour on the world market (from 400,000 to 800,000 tons), most of which has been shipped to third countries with either economic or political ties to the USSR.

Since last summer, Soviet purchases, or reported purchases of flour on the world market have increased dramatically. Although some of these purchases are likely for shipments to third countries, most of these recent flour purchases are probably for internal Soviet consumption. The sharp increase in USSR flour imports may be due in part to a disastrous potato crop and also an effort on the part of the Soviets to expand readily available food supplies. For the 1980/81 marketing year, USSR flour imports could well exceed a million tons (wheat equivalent).

1/ A review of USSR crop conditions was released on February 11, 1981, FG-6-81.

In contrast, coarse grain sales to the USSR from the new crop by the major suppliers in the Southern Hemisphere, particularly Argentina, have been slow to develop. These suppliers are expected to sell substantial quantities of coarse grains to the USSR for delivery during the April-June 1981 period. The quantity bought by USSR from these suppliers will be a key factor in determining the USSR's level of imports for 1980/81.

Given the amount of the USSR's wheat purchases to date the USSR's wheat imports have been increased by 500,000 tons to 17.5 million tons with a corresponding drop in the coarse grain import estimate to 16.5 million tons.

The pace of Soviet grain imports trailed off in December. Estimated imports during the July-December period totaled around 15 million tons with about 19 million still to move in order to reach the projected wheat and coarse grain import level of 34 million. So far, the Soviets have been able to ship or purchase over 31 million tons of the projected total imports of 34.5 million. The pace of shipments may continue subdued over the remaining winter months, but is expected to pick up sharply as the winter passes.

U.S. grain shipments to the USSR were resumed in October. Shipments through February 5, 1981, totaled nearly 5.9 million tons. Wheat shipments, so far, total nearly 2.1 million out of total sales of 3.0 million and corn exports 3.8 million against total sales of 5.0 million. In January, the most recent month for which complete data is available, the Soviets had reported shipping intentions of 1,685,000 tons, but lifted over 1.8 million tons. Soviet shipping intentions for February and March indicate that the bulk of the 8 million tons permitted during the fifth year of the agreement will be shipped by the end of March.

Livestock Situation for 1980

Although at the start of 1980, Soviet cattle, cow, hog, and poultry inventories were at record levels, the livestock sector during the rest of the year suffered from the effects of poor grain and forage harvests and the sales suspension. At the start of 1981, the number of sheep and goats on state and collective farms declined slightly from January 1, 1980 levels. Hog numbers in the private sector, which account for about 20 percent of the total, dropped three percent, while numbers went up slightly on collective and state farms. Hog losses in the private sector probably resulted from a reduction in grain feed availabilities, a serious potato shortage, and possible purchases of hogs from the private sector by the socialized farms in order to fulfill plans or to be eligible for above-plan bonuses.

Both cattle and hogs were slaughtered at lighter weights and in fewer numbers during 1980, causing a decline in meat output to 15.1 million tons from the 15.5 million of 1979. Meat output was four percent below the planned target, which already had been revised sharply downward. Milk output also fell--from 93.3 million tons to 90.7 million--despite record cow numbers, missing the target by about 5 percent.

The poultry sector, however, was more successful, probably because it received favorable treatment in light of the fact that poultry is a more efficient converter of grain to meat.

Official 1980 Production Estimate Reported 1/

The Soviet Union has officially estimated the 1980 grain crop, including pulses and miscellaneous grains, at 189.2 million metric tons. This is 10 million tons larger than the weather devastated 1979 harvest, but almost 46 million tons below the Soviet plan of 235 million. For the second consecutive year, the outturn was significantly below the plan level.

In addition to the total crop figure of 189.2 million tons, official Soviet estimates were published for the following grains: wheat, 98.1 million tons; rye, 10.2 million; corn, 9.7 million; rice, 2.8 million; and pulses, 6.4 million. Although production results for other grain crops were not published, it now seems likely that the excessive moisture throughout the growing and harvesting season was especially deleterious to spring barley--the major coarse grain--and oats. The current USDA estimate for 1980 Soviet coarse grain production is 80.7 million tons, while miscellaneous grains and pulses are estimated at 10.4 million.

Grain area for 1980 is estimated at 126.0 million hectares, the smallest since 1972. Wet weather delayed the spring planting in the European USSR, and probably limited the sown area. However, a more important factor contributing to the reduced area was the wet and protracted harvesting season which may have resulted in significant area being diverted to forage and other uses.

Only three times in the past decade have yields per hectare been lower than in 1980. Each of these years saw some part of the Soviet grain area seriously affected by drought. This year excessive precipitation over large areas of the European USSR appears to have reduced yield prospects, particularly for spring barley.

1981 USSR Crop Outlook

The Soviets have officially reported sowing of winter grain on 34 million hectares, 3 million below plan. Much of the shortfall in fall seeding could be made up this coming spring. Consequently, total grain area could equal or exceed the planned area of 128 million hectares. Recently, the Soviets

1/ This is the first part of a two-part release on the current USSR situation.

indicated a grain production plan for 1981 of 236 million tons. Only once, in 1978, has the USSR's grain production exceeded 230 million tons. Given the estimated 1981 grain area, yields in 1981 would have to be at record levels if planned production is to be reached.

Weather and Crop Conditions

December weather was very mild across the winter grain areas of European USSR. However, extremely cold weather in late November probably caused most of the winter grain to enter dormancy, limiting the possibility of additional plant development before spring. Snow cover improved markedly over much of European USSR during January. Consequently, when the winter turned extremely cold in late January, there was probably adequate protection for the grain plants. So far, during the winter of 1980/81, winterkill which typically has accounted for around 15 percent of the winter grain area, has likely been light. Much warmer weather in early February has melted the snow cover from most areas leaving winter grains exposed should cold weather return.

In those areas of European USSR where fall seeding was severely delayed. The winter grain plants may have entered dormancy in less than optimal condition. Consequently, when spring comes and dormancy is broken, grain in these areas could be more vulnerable. In many other areas of European USSR, the winter crops look good. The abundant soil moisture encouraged good seed germination, while mild winter encouraged additional tillering.

The outlook in the New Lands areas is not quite as bright. Snow cover, an important source of spring moisture, has improved somewhat across much of the area but still remains below normal. As it is still three or more months before spring field work begins, there is adequate time for soil moisture reserves to be recharged. Soil moisture levels in Central and South Central Asia are quite deficit which could create problems for the spring crops.

Prepared by USDA Interagency Task Force on USSR Grain Situation. The following USDA agencies participate as members of the USSR Task Force: Foreign Agricultural Service; Economics and Statistics Service; Agricultural Stabilization and Conservation Service; and the World Food and Agricultural Outlook and Situation Board.

USSR Grains: Area, Yield, and Production, 1971-80

	Winter Wheat	Spring Wheat	Total Wheat	Coarse Grains 1/	Other Grains 2/	Total Grains 3/
Harvested area (mil. ha.)						
1971	20.7	43.3	64.0	46.4	7.4	117.9
1972	15.0	43.5	58.5	53.5	8.0	120.2
